The lock actuator assembly requires two limit switches wired in series.

External Limit Switch

This switch will be installed on the mounting plate.

Internal Limit Switch

This switch will be installed inside the pulley assembly.

ITEM NO.	DESCRIPTION	QTY.
1	Mechanical Limit Switch	2
2	26AWG stranded wire, 500mm long	1
3	26 AWG stranded wire, 200mm long	1
4	26 AWG stranded wire, 600mm long	1

Internal Switch Wiring

	SCALE: 1:1	SHEET 6 OF 15

B

Exploded View

The limit switch button should be closer to the outside.

Zip-tie the wires down such that the head of the zip tie is inside the cavity and does not protrude out the bottom of the printed part.

SCALE: 1:1

SHEET 9 OF 15

2

1

B

B

Install the dangling switch in the wire harness from the prior step first; then install the screws.

Note the orientation of the switch from this view.

DETAIL D

Tighten the four M3 screws until you can no longer twist the stepper motor by hand relative to the plate.

A

A

Note: the face of planetary stepper should be flush with the face of the locking plates. The limit switch wire should curl out of this gap.

1

With calipers and hard wire cutters, measure and cut a length of Spring Guide to a length between 104mm and 104.5mm.

Follow the remaining instructions to create loops in both ends of the cut spring guide.

Wedge a knife blade into the last full loop on the spring guide.

Wedge a second knife blade into the same location as the prior knife blade.

With the blade that is farthest towards the end of the spring guide, bend it outwards to bend the last loop away from the spring guide.

Use pliers to open the loop.

Create a loop like this one on both ends of the spring. It need not be aesthetically perfect as we will crush it into another piece in the next step.

ITEM NO.	DESCRIPTION	QTY.
1	104mm Spring Guide (0.088-in outer diameter)	1

Note the orientations of both cinch plates on the ends of the spring guide.

Loop a cinch plate into each loop and use pliers to squeeze the loop such that the cinch plate can freely rotate but cannot fall off.

Compress the 3 components onto the motor shaft in the following order.

The floating pulley wires will need to ride smoothly in this location. Ensure that they do not snag when installed.

DETAIL C
SCALE 2 : 1

Note how the set screw must line up with the flat part of the shaft in the final assembly. Before installing the fixed pulley assembly, twist the motor shaft by hand such that the flat section properly engages the set screw.

Apply threadlock to this setscrew. Then fully-tighten it.

ITEM NO.	DESCRIPTION	QTY.

SHEET 14 OF 15

B

Gather the loose wires and zip tie them such that the long leads extend as show in the picture. Ensure that the pulley can freely rotate to the limit without being snagged. If it does snag, tighten up slack on the two wires that extend from the pulley and re-zip-tie.

A

Optional: sleeve the two loose wires for easy management.

1

B

From the connector bag that came with the Duet, install the 3-wire connector as shown. Polarity does not matter, but the wires must be installed on the outermost connector sockets.
